DELHIVERY

By : Suhani Kaur Saluja

Delhivery :

- **Positioning:** Largest integrated logistics player in India ~25% e-commerce logistics market share with tech-enabled network.
- **Success Factors:** Nationwide network, AI/automation, diversified services & financial profitability.
- **Customer Base:** Major e-commerce, D2C & retail brands, SMEs, manufacturers & individual shippers.
- **Current Plans:** Rapid delivery, deeper tier-2/3 expansion, digital services, cost optimization.
- **Challenges:** Competitive pricing pressure, e-commerce insourcing, cost structure of last-mile, infrastructure constraints.

DELHIVERY’S VISION:

Build infrastructure-led, tech-enabled logistics that works at national scale, not hyperlocal scale.

Delhivery’s app strategy focuses on sustainable scale over extreme speed, targeting urban consumers, D2C brands, and SMEs with same-day and intercity deliveries, without competing in loss-making 15-minute hyperlocal models.

Market Landscape

- Indian CEP & last-mile market growing at ~10–12% CAGR(IBEF, KPMG, RedSeer)
- Intra-city parcel movement growing faster due to:
 - Social commerce
 - SMB digitization
 - Returns & exchanges

- Consumer & SMB parcel demand exists
- But current adoption is low due to UX, trust, and pricing friction
- Meanwhile, hyperlocal 15-minute models exist but struggle with profitability

Segment	Players	Core Focus
Instant intra-city (≤15–30 min)	Porter, Dunzo, Rapido	Speed
Scheduled intra-city	Delhivery, XpressBees	Cost + reliability
Inter-city scale	Delhivery, Blue Dart	Network efficiency

PROBLEM STATEMENT

How would you design, position, launch, and scale a customer-facing Delhivery App in India so that people actually adopt and use it?

CORE PROBLEMS IN CURRENT APP STRATEGY

Problem: “I don’t know how to place an order”

- App opens → “Pickup from”
- No obvious “Send a package” CTA
- No first-time user flow
- No assistant / chatbot

Why this kills conversion?

60–70% of first-time users drop if the primary action is unclear

Apps without a clear CTA see 2–3× higher abandonment
Logistics apps affected more as Users are already anxious (cost, loss, damage)

Problem: No Trust Layer (Human / AI bot)

What users expect today?

- Instant chat
- Order help
- “What should I do?” guidance

Why this matters?

Presence of a chatbot alone increases conversion by 15–30%Especially important for:

- First-time users
- Non-tech-savvy users
- High-value shipments

Problem: Friction due to Dimensions

What Delhivery asks:

- Exact length × breadth × height
- Exact weight
- No relative options or go to options available

Why this matters?

This breaks Indian users specifically as they don’t own weighing scales or don’t know carton dimensions

Mental reaction: “This is too much effort. I’ll go to the courier shop.”

- **Separated Personal and Business modes to align flows with user intent; businesses get bulk, invoice, analytics tools**
- **Clarified the home screen with clear primary actions: Send a Parcel, Track Order, Help / Chat**
- **Eliminated dimension friction by using relatable package sizes, assisted by AI-based size selection**
- **Reduced price shock through two transparent options: Doorstep Pickup (convenience) and Drop at Hub (lower cost)**
- **Embedded real-time AI assistance and simple tracking, increasing trust and reducing anxiety**
- **Converted an ops-led app into a guided consumer experience, improving adoption without changing infrastructure or unit economics**

GTM STRATEGY

Target Customers:

Primary

- Urban & Tier-2 households (first-time shippers)
- Students & young professionals sending items home
- Home sellers (OLX, Instagram, WhatsApp sellers)

Secondary

- Small Instagram / WhatsApp businesses
- Micro-entrepreneurs already using Delhivery via aggregators

How We Reach Them:

ATL : Awareness & Trust (Mass)

Ad Concept: "Ghar Se Courier"

- Indian middle-class home
 - Mother asks son to send a parcel the "old way"
 - Son hesitates due to:
 - Long queues
 - Travel time
 - Uncertainty
 - Daughter opens Delhivery app: "Ghar se hi ho jaata hai"
 - Pickup happens at doorstep
- "Courier bhejna ab ghar se. Delhivery."

BTL : Conversion & Trial (Smart + Cheap)

On-the-Box Marketing

- Print on all outgoing parcels:
 - "Need to send a parcel? Pickup from your home."
 - QR code → App download → First order discount
- Hits high-intent users already in logistics mindset

STRATEGIC PARTNERSHIP: RETURNS AS A GROWTH ENGINE

Existing Reality

- Delhivery already handles returns for Meesho, Myntra, etc.
- Return pickups are loss-heavy but unavoidable

Proposed Synergy

Return-Linked Pickup Incentive

- When a return pickup is scheduled in a locality:
 - Nearby users get notified
 - "Send a parcel now & get 10% off"
 - Same vehicle, same route, higher utilization

Why This Works

- Reduces per-route cost
- Monetizes reverse logistics
- Improves customer acquisition with low CAC

Internal Synergies: How Delhivery Teams Work Together

Tech Team (Platform + AI Enablement)

- Builds the consumer app flows (Personal vs Business modes)
- Powers the AI assistant using existing shipment data, FAQs, and rate cards
- Maps relatable package sizes to backend volumetric weight logic
- Enables real-time-ish tracking views using existing scan and hub data

➡ Tech translates complex logistics into a simple, guided interface.

Logistics Team (Network & Capacity)

- Defines standard package size buckets aligned with sorting and line-haul constraints
- Flags eligible hubs for drop-at-hub option based on capacity and coverage
- Ensures doorstep pickups are routed through existing pickup schedules

➡ Logistics absorbs complexity without adding new infrastructure.

Operations Team (Execution & Ground Truth)

- Pickup agents verify and adjust package size/weight at doorstep
- Handle exception cases flagged by the app or AI assistant
- Feed back common issues to improve size mapping and FAQs

➡ Ops closes the loop between digital promise and physical execution.

Sales Team (SME & Growth Conversion)

- Onboards small businesses discovered via the app into formal business accounts
- Converts high-frequency personal users into SME contracts
- Uses app data to offer volume-based pricing and services

➡ Sales turns app adoption into long-term revenue.

Tech simplifies → Logistics enables → Ops validates → Sales scales.
